2020 Third Annual National Conference
November 19-21, 2020
Red Rock Hotel – Las Vegas, NV
IBD Surgeries

Erin Darguzas, MSN, AGACNP-BC
Northwestern Medicine
Chicago, IL
Disclosures

All faculty and staff involved in the planning or presentation of continuing education activities provided by the Annenberg Center for Health Sciences at Eisenhower (ACHS) are required to disclose to the audience any real or apparent commercial financial affiliations related to the content of the presentation or enduring material. Full disclosure of all commercial relationships must be made in writing to the audience prior to the activity. Staff at the Annenberg Center for Health Sciences at Eisenhower and Gastroenterology and Hepatology Advanced Practice Providers have no relationships to disclose.

No financial relationships to disclose.
Objectives

• Identify post operative management for IBD provider
• Key features of IBD Surgeries
• Indications for Surgery: UC and CD
• IBD Surgeries in the setting of UC
• IBD Surgeries in the setting of CD
  – Small bowel CD
  – Colonic CD
Discussion Points for the IBD Provider and Patient

- IBD meds postoperatively
- Recent steroid use prior to surgery
- Nutritional management
- ERAS protocol
- DVT prophylaxis
- Ostomy management
- Close postoperative outpatient clinic appointment
Key Features to Identify in IBD Surgeries

- Type of Surgery
- Open vs Lap vs Robotic
- Type of Stoma
- Anastomotic technique
- Measurement of length of remaining SB
- Pathology
- Extent of resection
Ulcerative Colitis Quick Stats

- Mortality rate related to severe attacks < 1%
- Estimated 20-30% rate of colectomy in UC after 20 years
- It has been recommended that about 85% of patients who do not respond to conventional steroid treatment within 6 days of hospitalization should undergo colectomy

### Indications for Surgery in Chronic UC

**Emergency situations**

- Fulminant disease activity unresponsive to maximal medical therapy
- Toxic megacolon
- Perforation
- Hemorrhage

**Elective situations**

- Disease activity refractory to medical therapy
- Complications related to adverse effects of chronic medical therapy
- Intestinal dysplasia or mass lesion
- Cancer
- Chronic disease
- Growth retardation in children

Surgical Management for Refractory Ulcerative Colitis

<table>
<thead>
<tr>
<th><strong>Total Proctocolectomy with End Ileostomy:</strong></th>
<th>Option for those at risk for pouch failure, such as patients with impaired anal sphincter muscle, previous anoperianal disease, or limited physiologic reserve secondary to comorbid conditions.</th>
</tr>
</thead>
</table>
| **1-Step IPAA:** | • Ileal pouch is made and anastomosed to the anus  
  (Used less often in order to optimize nutritional status. ) |
| **2-Step IPAA:** | • Total proctocolectomy with creation of Ileal Pouch Anal Anastomosis (IPAA)  
  • Reversal of ileostomy |
| **3-Step IPAA:** | • Abdominal colectomy with ileostomy  
  • Complete proctectomy with creation of IPAA  
  • Reversal of Ileostomy |

Surgical Management for Refractory Ulcerative Colitis

A Proctocolectomy

Entire colon removed

Rectum removed

B Ileal J-pouch, stapled anastomosis, temporary ileostomy

Ileal J-pouch (reservoir)

Stapled ileal pouch-anal anastomosis

C Closure of the temporary ileostomy

Ileal pouch-anal anastomosis

Surgical Management for Refractory Ulcerative Colitis

A. Proctocolectomy with permanent ileostomy (Brooke ileostomy)

B. Proctocolectomy with continent ileostomy (Kock ileostomy)

C. Colectomy and stapled ileal pouch distal rectal anastomosis (IPDRA)

D. Colectomy, mucosal proctectomy, and ileal pouch-anal canal anastomosis (IPAA)

E. Abdominal colectomy with ileorectal anastomosis
## Complications of IPAA

<table>
<thead>
<tr>
<th>Short-term</th>
<th>Long-term</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Small-bowel obstruction – 15%</td>
<td>• Small bowel obstruction</td>
</tr>
<tr>
<td>• Pouch Leak</td>
<td>• Anastomotic stricture – 8-14% within 10 yrs</td>
</tr>
<tr>
<td>• Pelvic Sepsis – 20%</td>
<td>• Fistula of the pouch</td>
</tr>
<tr>
<td>• Anastomotic Stricture</td>
<td>• Pouch dysfunction</td>
</tr>
<tr>
<td></td>
<td>• Pouchitis – 50% by 3-4 yrs</td>
</tr>
<tr>
<td></td>
<td>• Sexual dysfunction/Female infertility – 3x increased risk</td>
</tr>
</tbody>
</table>

Crohn’s Disease Quick Stats

• Surgical intervention is individualized
• Surgery rates over time: 1 year: 15% 5 yrs: 30% 10 yrs: 50%
• 5 years following initial surgery:
  – 80% endoscopic/radiologic recurrence
  – 50% clinical recurrence
• The most significant factor affecting postoperative CD recurrence was found to be smoking
• Fibrotic stricture of Crohn’s Disease affects approximately half of all patients

### Indications for Surgery in Crohn’s Disease

<table>
<thead>
<tr>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowel perforation</td>
</tr>
<tr>
<td>Intra-abdominal, retroperitoneal, or abdominal wall abscess refractory to nonoperative management</td>
</tr>
<tr>
<td>Gastrointestinal bleeding refractory to nonoperative management</td>
</tr>
<tr>
<td>Symptomatic fibrotic stricture causing intestinal obstruction</td>
</tr>
<tr>
<td>Enteric fistula refractory to medical therapy</td>
</tr>
<tr>
<td>Small bowel or colorectal cancer</td>
</tr>
<tr>
<td>Persistent inflammation refractory to medical therapy</td>
</tr>
<tr>
<td>Free or contained perforation of the small bowel</td>
</tr>
</tbody>
</table>

# Laparoscopic vs Open Abdominal Surgery

<table>

</tr>
</tbody>
</table>

**Results similar**

Tan et al. 2007. Meta analysis: 14 studies, 818 pts.\(^1\)
Lee et al. 2012. Retrospective study: 1917 patients (644 laparoscopic).\(^2\)

Small Bowel Resection

- The most common procedure is the ileocecal resection
- Indicated for short segment stricturing or fistulizing disease
- Recurrence of disease occurs most often proximal to the anastomosis after ileocolonic resection
- Gross inspection of margins

Fibrotic Development in Crohn’s Disease

Small Bowel Resection and Anastomotic Technique

• **End-to-end**: bowel naturally reposition into it’s normal orientation and often sutured end-to-end

• **Side-to-side**: unnaturally reconnected in an anti-peristaltic fashion and most often stapled
  
  – Quick resection time
  
  – Risk of fecalization leading to concern for bacterial overgrowth

Zurbuchen et al. *Lang Arch Surgery*. 2013. (Randomized trial in CD patients found no difference in leak rate between end-to-end or side-to-side anastomosis)
Anastomotic Technique

End-to-end Anastomosis

Side-to-side anastomosis

Chapter 55. Intestinal Stomas. In: The ASCRS Textbook of Colon and Rectal Surgery, 3e.
Strictureplasty

Considerations:

- Diffuse involvement of the bowel with multiple strictures
- Stricture in a patient who has undergone previous major resection of small bowel (>100 cm)
- Rapid recurrence of Crohn’s Disease manifested as obstruction
- Stricture in a patient with short bowel syndrome
- Nonphlegmonous fibrotic stricture
Type of Strictureplasty

Heineke-Mikulicz

Finney

Type of Strictureplasty

Side-to-Side Isoperistaltic (Michelassi)

Complications of Strictureplasty

- Recurrence of stricture
- Abscess
- Fistula
- Obstruction
- Postoperative ileus

Surgical Interventions: Colonic Crohn’s Disease

- Identify extent of colonic involvement: pancolonic vs rectal sparing disease.

- **Segmental colectomy**: isolated CD of colon; colonic stricture.

- **Total colectomy with ileorectal anastomosis**: Colonic, rectal-sparing disease.

- **Pancolonic CD**: Total proctocolectomy with end ileostomy and proctectomy.

Summary

• Reviewing post operative management before and after surgery is an essential role for the IBD provider.

• Surgical management of UC most often is curative, but routine monitoring by IBD provider is recommended.

• Surgical intervention for Crohn’s Disease is individualized.
